

README- General Notes and points for All Assignments

(Doubt classes are conducted 8pm-9:30pm Mon-Saturday over virtual campus) (use google collab or Kaggle free GPU notebooks for training purpose to complete assignments fast)

Submission Guidelines

1. Submit all code in a single ZIP file or GitHub repository link
2. Include a main README with setup instructions
3. Ensure all paths are relative (no hardcoded absolute paths)
4. Test your code on a fresh environment before submission
5. Include sample outputs/results in the submission

Academic Integrity

- You may use online resources and documentation
- Clearly cite any code borrowed or adapted from others
- Do not copy entire solutions from GitHub/Kaggle
- Collaboration is encouraged for discussion, but code must be your own

Getting Help

- Use office hours for conceptual questions
- Post questions in course forum (without sharing solutions)
- Debug systematically before asking for help
- Provide minimal reproducible examples when seeking assistance

Best Practices for Success

1. **Start early:** Don't wait until the last minute
2. **Experiment iteratively:** Start simple, add complexity gradually
3. **Version control:** Commit frequently with meaningful messages
4. **Document as you go:** Don't leave documentation for the end
5. **Test frequently:** Validate each component before integrating
6. **Save checkpoints:** Don't lose hours of training to crashes
7. **Ask for feedback:** Get peer reviews on your approach

Good luck with your Deep Learning journey.

Remember, the goal is not just to complete assignments, but to deeply understand the concepts and develop practical skills. Focus on learning, experimenting, and building intuition about how neural networks behave. These assignments are designed to prepare you for real-world deep learning challenges.

“Thankyou”
